

LED MATRIX PROJECT

Pixel Art

D-1

What did I learn?

- working principle of an LED matrix.
- Identify the required components and their functions.
- Connect the LED to the microcontroller.

Activities performed

1. Gathered required components such as:
 - Arduino UNO
 - Breadboard
 - Jumper wires
 - Downloaded Arduino IDE
2. Connected LED to breadboard according to pixel diagram(4x4)

Problems Encountered

MAX7219 driver module required to control the LED matrix was not available on the first day. Without the module, it was difficult to interface the LED matrix efficiently with the microcontroller.

At the beginning of the project, it was difficult to understand the wiring connections between the LED matrix, resistors, and the microcontroller. This resulted in confusion during the setup process.

Conclusion

The first day of the LED Matrix Project was pretty successful. The hardware setup was completed and common issues were identified which asks for further deep learning for solving the identified problems.
